DETAILED ACTION

EXAMINER'S AMENDMENT

An examiner's amendment to the record appears below. Should the changes
and/or additions be unacceptable to applicant, an amendment may be filed as provided
by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be
submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with William Kidd on 4/7/2009 and 4/13/2009.

The application has been amended as follows: Regarding claim 19, on line 8 after "modules" insert -- , where one of the processor modules comprises an instruction pipeline circuit; --.

Regarding claim 20, on line 1 remove "processor modules comprises an" and insert on line 2 after "circuit" – comprises a plurality of instruction pipeline stages. --.

Regarding page 14 of applicant's specification concerning section 041 (line 6 of that section) remove ", as well as media accessible via transmission media or signals such as electrical, electromagnetic, or digital signals, conveyed via a communication medium such as a network and/or a wireless link."

Allowable Subject Matter

2. The following is an examiner's statement of reasons for allowance: Regarding claims 1 and 11, the prior art of record, Shohara (US Pat# 6,473,607) teaches a processing unit 42 or 50 (Fig. 1); at least one processing module 42 or 50 (Fig. 1); a timer for generating a time-out interval 70 (Fig. 1); and power control logic 42 or 60 (Fig. 1).

Art Unit: 2618

2) for detecting a sleep instruction and placing the processing unit and at least one processing module in a low-power state (Col. 10 lines 39-41 and Col. 12 lines 52-64), where the power control logic is operative in response to a wake-up signal (Col. 6 line 59-Col. 7 line 32) to reactivate the circuit, and consequently at least one processing module only to the extent required by the wake-up signal (Col. 12 lines 32-64, Col. 13 lines 11-13, and Col. 13 lines 61-65).

Wichman teaches an instruction pipeline circuit (Sections 0014-0015, 0035, 0042, and 0047).

The prior art of record fails to teach a data processor for use in a wireless communication device, comprising a processing unit; an instruction pipeline circuit; at least one processing module; a timer for generating a time-out interval; and power control logic for detecting a sleep instruction and placing the processing unit, instruction pipeline circuit and at least one processing module in a low-power state, where the power control logic is operative in response to a wake-up signal to reactivate the instruction pipeline circuit, and consequently at least one processing module only to the extent required by the wake-up signal.

Based off the Board of Patent Appeals decision filed on 3/27/2009 and the fact that it would not be obvious for one skilled in the art to combine Shohara in view of Wichman are examiner's reasons for allowance. Further, applicant's remarks filed on 1/7/2008 state reasons for allowance as well.

The prior art of record fails to teach the claimed subject matter as claimed and substantially connected in claims 1-10 and 11-18.

Art Unit: 2618

Regarding claim 19, Shohara teaches storing one or more wake-up conditions and a time-out interval in a register 24 (Fig. 1, Col. 6 line 59-60, and Col. 5 lines 21-26); receiving a processor sleep instruction (Col. 5 lines 21-33, Col. 6 line 59- Col. 7 line 32, Col. 10 lines 39-41, and Col. 12 lines 52-64); executing any pending instructions received by the processor before the sleep instruction (Col. 5 lines 21-64); powering down the one or more processor modules (Col. 5 lines 21-33, Col. 6 line 59-Col. 7 line 32, Col. 10 lines 39-41, and Col. 12 lines 52-64); receiving a processor wake-up signal corresponding to one of said wake-up conditions or said time-out interval (Col. 6 line 59-Col. 7 line 32); powering up only the processor modules required to respond to the detected processor wake-up signal (Col. 6 line 59-Col. 7 line 32. Col. 12 lines 32-64, Col. 13 lines 11-13, and Col. 13 lines 61-65).

Lindskog (US Pat# 6,622,251) teaches executing any pending instructions received by the processor before the sleep instruction (Col. 2 lines 48-65 and Col. 4 lines 44-55).

Wichman teaches an instruction pipeline circuit (Sections 0014-0015, 0035, 0042, and 0047).

The prior art of record fails to teach a method for managing power in a communications processor by selectively removing one or more processor modules from a standby mode, comprising storing one or more wake-up conditions and a time-out interval in a register; receiving a processor sleep instruction; executing any pending instructions received by the processor before the sleep instruction; powering down the one or more processor modules, where one of the processor modules comprises an

Art Unit: 2618

instruction pipeline circuit; receiving a processor wake-up signal corresponding to one of said wake-up conditions or said time-out interval; powering up only the processor modules required to respond to the detected processor wake-up signal.

Based off the Board of Patent Appeals decision filed on 3/27/2009 and the fact that it would not be obvious for one skilled in the art to combine Shohara in view of Lindskog and further in view of Wichman are examiner's reasons for allowance.

Further, applicant's remarks filed on 1/7/2008 state reasons for allowance as well.

The prior art of record fails to teach the claimed subject matter as claimed and substantially connected in claims 19-20.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Conclusion

3. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Miner discloses a low-powered communication system and method of operation. Peponides discloses a method and apparatus for regenerating the symbol clock of a cellular telephone following a sleep cycle. Son discloses a system and method for power conservation in a wireless communication handset. Schmidt discloses a flexible processing system. MacInnis discloses a method or communicating between modules in a decoding system.
